

FieldLog

Audit-ready pesticide records, captured where applications happen.

The Problem

Mid-to-large agricultural operations that hire multiple spray contractors face a compliance gap that is invisible until an EPA audit arrives. Under FIFRA, every pesticide application must be documented with the applicator's name, product and EPA registration number, application rate, acreage, date and time, weather conditions (wind speed, direction, and temperature), target pest, crop, and pre-harvest intervals. In practice, this documentation arrives as a mix of text messages, photos, and spreadsheets — scattered, unverified, and nowhere near audit-ready. Operation managers bear the legal liability but have no reliable system to capture, verify, or store contractor records in a compliant format.

The Solution

FieldLog is a mobile-first SaaS platform purpose-built for pesticide application record compliance. Contractors log applications directly in the field using a simple mobile interface that works offline — a critical requirement given poor cellular signal in rural areas. At the moment of logging, FieldLog automatically captures real-time weather data, eliminating one of the most commonly missing data points in compliance records. Once submitted, contractor logs are immutable: operation managers can review and verify records but cannot alter what the contractor submitted. This chain of custody protects both parties. Managers can generate audit-ready PDF exports at any time in the regulatory format required by the EPA.

Target Market & Go-to-Market

FieldLog targets operation managers of mid-to-large agricultural operations that rely on contract applicators — a segment that is systematically underserved by existing farm management software, which is typically designed around the farmer as the sole operator. Validated pricing from customer discovery is \$50–100 per month per operation. The initial traction target is 5–8 pilot customers in Southeast Missouri agriculture, with expansion driven by referrals within contractor networks and agricultural lender requirements for documented compliance practices.

Key Differentiators

Three capabilities were validated as decisive through customer interviews: offline-first logging (poor field connectivity is a universal pain point), immutable contractor records (accountability without the ability to alter data after the fact), and automatic weather capture at application time. These differentiators are not available in combination from any existing compliance or farm management tool, creating a clear product gap FieldLog is built to fill. The MVP scope — contractor logging, manager verification, and PDF export — is estimated at a 9–10 week build, with weather API integration and automated EPA registration number validation as near-term follow-on features.
