

Business Canvas: Agricultural Compliance & Record-Keeping Platform

1. Problem

Top Problems Identified: - Manual compliance record-keeping: Applicators spend hours manually documenting EPA-regulated applications across multiple devices and paper records - Regulatory non-compliance risk: Complex RUP regulations create liability and potential fines for farms unable to track and prove proper application procedures - Inefficient data organization: Weather data, application records, and EPA database information are scattered across disconnected sources, making compliance audits time-consuming

Existing Alternatives: Paper logs, spreadsheets, disconnected weather apps, manual EPA database lookups, or no systematic tracking at all

2. Customer Segment

Primary Target: - Demographics: Licensed applicators in SE Missouri and expanding to 10-state region; farm operators managing pesticide/herbicide applications; agricultural consultants and advisors - Behaviors: Regularly apply EPA-regulated products; face compliance audits; value time savings and reduced liability; use mobile devices in field operations - Pain Points: Manual record-keeping burden, fear of non-compliance penalties, difficulty proving regulatory adherence during inspections

Early Adopters: Progressive farm operations in SE Missouri with strong relationships to local ag extension services and consultants who value compliance efficiency

3. Unique Value Proposition

Core UVP Statement: The only mobile-first, offline-capable compliance platform that consolidates EPA RUP regulations, weather data, and application records into a single source of truth—enabling licensed applicators to log compliant applications in minutes, not hours, while proving regulatory adherence instantly.

Key Differentiators: - Offline-first architecture: Works without cellular signal in remote fields - Integrated RUP database: EPA regulations built in, not external lookups - Unified data model: Weather, location, regulatory requirements, and application logs in one platform

4. Solution

Core Features: - Mobile app with offline-first architecture: Log applications anywhere, sync when connectivity available - Integrated EPA RUP database: Real-time regulatory requirements at point of application - Intelligent compliance checking: Alerts if application violates EPA rules before submission - Automated PDF export: Generate audit-ready compliance reports with GPS location, weather, and application details - Weather integration: Capture conditions at time of application for regulatory documentation

MVP Scope: iOS/Android app, offline logging, RUP database lookup, PDF export, basic user authentication

5. Channels

Acquisition Channels: - Direct sales through regional ag consultants and extension services in SE Missouri (first-mover advantage) - Partnerships with state agricultural departments and university extension programs - Word-of-mouth and referrals from early pilot users (50–100 applicators) - Regional ag trade shows and conferences

Activation: Onboard through consultant/advisor partnerships; provide training and support; free beta for pilot applicators

Retention: In-app compliance alerts, seasonal usage patterns (peak during application season), integration into consultant workflows

6. Revenue Streams

Primary Revenue: - Model: Subscription (SaaS) - Pricing: \$50–150/month per operation (tiered by operation size/complexity) - Pilot approach: Free beta for 50–100 applicators to validate product-market fit

Secondary Revenue: - None planned at this time; open to premium features (advanced analytics, integrations) in future

7. Cost Structure

Fixed Costs (Monthly): - Shared services allocation (admin, marketing, sales, development support): \$5K–10K - Cloud hosting (AWS/Firebase backend, database, API): \$2K–5K - EPA database maintenance (quarterly updates, validation): \$500–1K - Tools and software (dev tools, monitoring, security): \$1K–2K

Variable Costs (Scale with Customers): - Weather API calls: \$0.50–2/user/month - Stripe payment processing: ~3% of MRR - Customer support: \$30–50/customer/month (scales after 200+ customers)

Key Cost Drivers: Scaling technical backend (hosting, API calls, database); sales and marketing for customer acquisition

8. Key Metrics

North Star Metric: Monthly Active Applicators (MAA)—licensed applicators actively logging applications each month

Supporting Metrics: - Acquisition: New operations signed up/month; target 10 → 50/month by Year 1 - Activation: 70%+ of signups complete first application log within 7 days - Revenue: MRR growing from \$2.5K–7.5K (pilot) to \$25K–75K by Year 1 - Retention: <5% monthly churn; >85% annual renewal rate

Growth Target: 10x year-over-year MAA growth

9. Unfair Advantage

Competitive Moat: First-mover distribution advantage through established relationships with SE Missouri ag consultants, extension services, and regional advisors. Early locked-in channels create barriers for competitors entering later.

Defensibility Factors: - First-mover distribution: Regional relationships with consultants and extension services difficult for competitors to replicate - Data and predictive AI: Accumulated compliance records, weather patterns, and application data enable future AI-driven features (risk alerts, recommendations, optimization) that late entrants cannot match without years of data - Network effects: More applicators generate more valuable regional insights and recommendations

Long-Term Vision: By accumulating compliance data across 10 states, become the authoritative compliance and intelligence platform for ag applicators. Late-entering competitors face multi-year data disadvantage; advisor partnerships become increasingly sticky.
